DETAILED ACTION

1. This application contains claims directed to the following patentably distinct species of the claimed invention:

(i) an embodiment of an optical scanning device which comprises a scanning optical system includes a scanning optical element disposed so that, with respect to a sub-scan direction, a principal ray of the deflected light beam passes a portion other than an optical axis, wherein said scanning optical element has a sagittal aspherical amount changing surface in which an aspherical amount of a sagittal changes along a main scan direction of said scanning optical element, and wherein, throughout the whole surface to be scanned, the position in the sub-scan direction upon which the deflected light beam impinges is made even; and an image forming apparatus using the same. The embodiment is shown in Figs. 1-11.

(ii) an embodiment of an optical scanning device which comprises a scanning optical system includes a scanning optical element arranged so that, upon the surface to be scanned and with respect to a sub-scan direction, imaging positions of two light beams being obliquely incident on a plane, perpendicular to a rotational axis of said deflecting means, with certain oblique incidence angles Y and y' ($0 \neq y < y'$), respectively, are approximately registered with each other; and an image forming apparatus using the same. The embodiment is shown in Figs. 12-16.

(iii) an embodiment of an optical scanning device wherein a plurality of light beams from a source means are directed to a light deflecting means, and the plurality of light beams from said deflecting means are directed to corresponding surfaces, to be scanned, respectively, by an optical scanning means, and wherein said optical scanning means includes a single scanning optical element having an anamorphic surface, and said scanning optical element has, within a

main scan sectional plane, one surface which is an aspherical surface; and an image forming apparatus using the same. The embodiment is shown in Figs. 17-22.

Applicant is required under 35 U.S.C. 121 to elect a single disclosed species for prosecution on the merits to which the claims shall be restricted if no generic claim is finally held to be allowable. Currently, no claim is generic.

Applicant is advised that a reply to this requirement must include an identification of the species that is elected consonant with this requirement, and a listing of all claims readable thereon, including any claims subsequently added. An argument that a claim is allowable or that all claims are generic is considered nonresponsive unless accompanied by an election.

Upon the allowance of a generic claim, applicant will be entitled to consideration of claims to additional species which are written in dependent form or otherwise include all the limitations of an allowed generic claim as provided by 37 CFR 1.141. If claims are added after the election, applicant must indicate which are readable upon the elected species. MPEP § 809.02(a).

Should applicant traverse on the ground that the species are not patentably distinct, applicant should submit evidence or identify such evidence now of record showing the species to be obvious variants or clearly admit on the record that this is the case. In either instance, if the examiner finds one of the inventions unpatentable over the prior art, the evidence or admission may be used in a rejection under 35 U.S.C. 103(a) of the other invention.

2. Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a request under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(i).
